

Field Project Synopsis

1. Name of the Student :-

Ghadge Avishkar Vitthal

2. Name of the Guide :-

PROF.K.S. Chaure Madam

3. Title of the Field Project :-

Promote Inorganic Farming.

4. Objectives:-

The main goal of this field project is to understand and promote the effective use of **inorganic farming** for improving agricultural productivity and sustainability.

1. To study the current scenario of inorganic farming practices in the selected region.
2. To analyze the types of inorganic fertilizers, pesticides, and chemical inputs used by farmers and their effectiveness on crop yield.
3. To evaluate the cost-benefit ratio of inorganic farming compared to traditional and organic farming.
4. To identify farmers' perceptions, awareness levels, and challenges related to inorganic farming.
5. To promote best practices for safe and efficient use of inorganic farming methods through awareness campaigns and educational materials.
6. To recommend strategies for balancing productivity enhancement with soil and environmental safety.

SMART Framework:

- **Specific:** Focused on understanding, analyzing, and promoting inorganic farming practices.
- **Achievable:** Supported by structured surveys, field visits.
- **Relevant:** Addresses agricultural productivity, economic growth, and food security.
- **Time-bound:** The project will be completed within a period of **60 hours**.

5. Research Methodology:-

The methodology involves a systematic approach combining both **qualitative and quantitative research** techniques to gather comprehensive insights.

Research Design:- Descriptive and exploratory research design will be used to describe existing inorganic farming practices and explore ways to enhance them.

Data Collection Methods:

- **Primary Data:**

- Structured surveys with farmers using inorganic methods.
- Field observations of crop performance and fertilizer usage patterns.

Tools for Analysis:

- Comparative analysis between inorganic and organic farming productivity levels.
- SWOT analysis (Strengths, Weaknesses, Opportunities, Threats) to evaluate the effectiveness of inorganic farming.

Time Frame:-

60 hours

6. Work Outline:-

1. Requirement Analysis:

- Identify the target area (village/district) and select farmers practicing inorganic farming.
- Determine key variables like crop type, fertilizer type, and yield level.

2. System Design:

- Prepare survey questionnaires and interview formats for farmers and experts.

3. Data Collection:

- Conduct field visits and distribute questionnaires.
- Record farmers' experiences, costs, inputs used, and yield outcomes.
- Capture photographs and observations of fields and practices.

4. Maintenance:

- Provide recommendations for continuous improvement and sustainable use of inorganic inputs.

- Encourage monitoring systems to track fertilizer usage efficiency.

7. Expected Outcomes:-

1. Key Findings:

- A detailed understanding of inorganic farming practices, benefits, and challenges.
- Statistical evidence of improved crop yield and profitability through inorganic methods.
- Identification of gaps in knowledge and implementation among farmers.

2. Practical Recommendations:

- Suggestions for optimal fertilizer dosage and chemical application schedules.
- Promotion of integrated nutrient management to prevent soil depletion.

3. Contribution to Knowledge and Industry Application:

- Development of a practical guide for farmers to implement inorganic farming effectively.
- Valuable insights for policymakers to improve agricultural extension services. Contribution to the ongoing discussion on balancing productivity with environmental health.
